UK Visas & Immigration
Global Talent Visa — Tech Nation (Digital Technology)
United Kingdom

To Whom It May Concern,

I am writing to provide my strong endorsement of Odeyemi Olusegun Israel for the UK Global Talent Visa under the Exceptional Promise category.

I make this recommendation as the Founder and Director of OTB-MIDAS LIMITED, drawing on over 20 years of enterprise systems experience across mission-critical infrastructure in financial services, logistics, and retail. My professional background includes roles supporting and integrating systems for organisations such as UBS, JP Morgan Chase, DHL Aviation, and Walgreens Boots Alliance, where system reliability, auditability, and integration are critical.

I became familiar with Olusegun's work through my direct review of his system design, architecture, and research materials, particularly his Anti-Money Laundering Transaction Trust Protocol (AMTTP). On that basis, I am well placed to assess both the technical substance of his work and its relevance to real-world enterprise environments.

Technical Innovation and Industry Relevance

From an enterprise systems perspective, this work stands out because it tackles a structural limitation that has persisted across both traditional finance and blockchain systems: the separation between transaction execution and compliance evaluation.

Most existing systems perform compliance checks after execution, creating operational risk and reconciliation overhead. Olusegun's architecture instead introduces a pre-settlement model, where machine learning inference, graph-based analysis, and policy evaluation are executed within the transaction lifecycle itself.

This is not a minor improvement—it represents a shift toward execution-aware compliance, which is highly relevant for institutions attempting to integrate blockchain technologies into regulated environments.

The system's design—comprising containerised microservices, API-driven orchestration, and blockchain interaction—reflects a level of engineering maturity consistent with modern enterprise platforms.

Original Research and Analytical Contribution

What strengthens this work further is the underlying analytical framework.

Olusegun’s research on Blind Spot Decomposition Theory (BSDT) provides a structured approach to identifying hidden risk factors within complex systems. Rather than relying solely on observable indicators, the framework decomposes system behaviour to expose latent structures that may lead to instability or failure.

From a systems engineering perspective, this is significant. Many enterprise risk systems struggle with hidden dependencies and indirect failure paths. His approach introduces a way to model these “blind spots” explicitly, enabling earlier and more informed detection.

Importantly, this framework is not confined to a single domain. Its applicability across financial systems, blockchain environments, and other complex infrastructures indicates a level of generalisation and original thinking that is uncommon among early-career engineers.

In AMTTP, this translates into a risk engine that is not purely reactive but structurally informed.

Engineering Maturity and Practical Application

In the environments I have worked in—particularly banking and payment systems—deterministic behaviour and auditability are non-negotiable.

Olusegun’s system combines advanced analytical models with structured, policy-driven execution, ensuring that outcomes remain traceable and reproducible. This is essential for compliance, where decisions must be justified and audited consistently.

This balance between analytical sophistication and deterministic execution is rarely achieved in early-stage systems, yet it is clearly reflected in his design.

A major barrier to adopting new technologies in financial institutions is integration with existing systems.

Having spent much of my career working on IBM i platforms and integrating them with modern applications, I recognise the importance of designing systems that can coexist with legacy infrastructure.

Olusegun’s use of modular SDKs and service-oriented architecture demonstrates a clear understanding of this challenge. His approach enables integration without requiring wholesale system replacement, which is critical for real-world adoption in enterprise environments.

Potential Contribution to the UK Technology Sector

The UK's financial technology sector continues to evolve, with increasing focus on secure transaction processing, compliance automation, and interoperability between traditional and digital systems.

Olusegun's work sits directly within this space. By combining a novel risk modelling framework with a practical execution architecture, he demonstrates both theoretical depth and applied engineering capability.

While AMTTP is at an early stage, the clarity of its design, the depth of its underlying logic, and its alignment with real-world system requirements indicate strong potential for further development and application within the UK's fintech ecosystem.

Final Recommendation

In my professional opinion, Olusegun is among the most promising emerging technology professionals I have encountered in recent years in the area of financial systems and compliance architecture.

He combines strong technical and architectural capability, original research thinking, practical understanding of enterprise systems, and clear potential for future leadership in the technology sector.

I recommend him for the UK Global Talent Visa under the Exceptional Promise category without reservation.

Yours faithfully,

Mr Oluwatoyin Olufeko
