UK Visas & Immigration
Global Talent Visa — Tech Nation (Digital Technology)
United Kingdom

Dear Sir/Madam,

I endorse Odeyemi Olusegun Israel for the UK Global Talent Visa under the Digital Technology route. My endorsement focuses on **the commercial viability of his technology, its competitive differentiation, and his capacity to create significant economic value in the UK.**

I hold a PhD in Computer Engineering and serve as Vice President of Sales for Sabre Corporation's West Africa operations. Sabre processes over US\$260 billion in annual travel spend and serves 400,000+ travel agencies worldwide. I am responsible for enterprise technology sales cycles at financial institutions, airlines, and government agencies. My PhD gives me the technical foundation to evaluate what Olusegun has built; my commercial role gives me the lens to assess whether it solves problems that paying customers actually have. I have known Olusegun for 10+ years.

AMTTP solves a real, unsolved market problem.

The blockchain compliance market has a structural deficiency: *every existing solution operates after settlement*. Chainalysis, Elliptic, and TRM Labs—collectively valued at over US\$10 billion—provide post-settlement forensics. They flag; they do not prevent. For FCA- or FinCEN-regulated institutions, discovering *after the fact* that they processed an illicit transaction creates regulatory liability no amount of alerting can eliminate.

Olusegun's Anti-Money Laundering Transaction Trust Protocol (AMTTP) is, to the best of my knowledge, the only system that provides **pre-settlement compliance enforcement** on blockchain transactions. It scores, classifies (Approve / Review / Escrow / Block), and gates transactions at the protocol level within Ethereum's 12-second block window. This is not incremental—it is a categorically different value proposition.

Enterprise-grade technology, not a prototype.

In my role I distinguish quickly between “demo-ready” and “deployment-ready” technology. AMTTP is the latter:

- **SDK maturity:** TypeScript SDK with 19+ endpoints (risk, KYC, sanctions, disputes, bulk ops up to 10k txns), EIP-712 signing, HMAC-SHA256 webhooks. Python SDK mirrors it. Both open-sourced.
- **Architecture:** 17 containerised microservices with health checks, circuit breakers, and Prometheus/Grafana monitoring.
- **Security:** JWT validation, per-key rate limiting, ECDSA oracle signing with 90-day rotation, nonce+TTL replay protection, UI Integrity Service (DOM mutation monitoring).
- **ML pipeline:** ROC-AUC 0.9879, 21 features, zero training-serving skew.
- **Smart contracts:** 18 Solidity contracts on Sepolia (risk attestation, LayerZero cross-chain, Kleros disputes, UUPS proxy upgradeability).

Security and ML pipeline maturity at this depth is typically the product of a dedicated team, not a solo developer.

Competitive positioning and IP.

1. **First-mover in pre-settlement compliance**—incumbents would need to re-architect their entire products.
2. **Zero-knowledge compliance (zkNAF)**—Groth16 ZK-SNARKs resolving GDPR-vs-AML at the cryptographic level, with verifiers deployed on-chain.
3. **UK patent filed** (4 March 2026): 25 claims across 13 invention groups covering AMTTP, zkNAF, ML detection, adaptive friction, and Navier-Stokes viscosity.
4. **Open-source SDKs / proprietary core**—the Stripe/Twilio playbook for adoption.

Research that feeds a product pipeline.

Each research paper produces technology that extends AMTTP:

- **BSDT¹:** diagnoses *why* the ML model misses fraud, enabling targeted correction without retraining.
- **UDP²:** 14 composable operators, AUC 0.972 with a single hyperparameter set—eliminating per-client tuning.
- **Blind-Spot Decomposition and the Geometry of System Collapse³:** 6-quarter GFC early warning (zero false alarms), Terra/Luna detection at hour 23 ($r = 0.996$), ERCOT grid prediction 72 hours early (AUC 0.9997). These are product features, not just academic results.

The cross-domain validation proves the technology is not brittle—the exact evidence enterprise buyers need.

Value to the UK and my assessment.

The FCA's crypto-asset framework will create jurisdiction-level demand for protocol-level compliance. AMTTP serves this demand natively. Immediate customer segments include FCA-regulated exchanges (Revolut, Coinbase UK), institutional DeFi participants, and CBDC infrastructure providers. The UK patent anchors IP in the UK; commercialisation would create UK-based jobs in sales, engineering, and compliance.

In 10+ years in enterprise technology, I have not encountered another individual who combines this level of technical depth with this degree of commercial readiness. Olusegun is a technically exceptional founder with a viable product, defensible IP, and a research programme that feeds directly into product differentiation.

I recommend him for the Global Talent Visa without reservation.

Yours faithfully,

Dr. [FULL NAME], PhD
