

Tech Nation Visa - Exceptional Promise

Criteria: Mandatory Criteria (Technical Leadership / Innovation)

Applicant: Odeyemi Olusegun Israel

Evidence 5: Engineering Authorship & Codebase Provenance

1. Continuous Deep-Tech Development & The 'Green Squares'

To evidence my sustained authorship of the AMTTP infrastructure, the GitHub contribution graph (*below*) shows intensive and continuous software engineering activity over time. Building a production-grade Web3 compliance system requires bridging multiple languages (Python, TypeScript, Dart, Solidity) and frameworks (FastAPI, Next.js, Flutter, Hardhat), and this commit history supports my claim that I was the core technical founder directly writing the system rather than merely managing outsourced work.

Figure 1: Verified GitHub contribution graph (github.com/segetii) — 91% commits, contributions to *segetii/AMTTP*, *segetii/fintecdataset*, and *segetii/fintech* repositories.

2. Quantified Engineering Output

The raw Git statistics below, extracted directly from the AMTTP repository, demonstrate an extraordinary volume of sustained, self-directed engineering across 7 continuous months:

Metric	Value
Total commits (all branches)	361
Lines of code added	3,560,921
Lines of code deleted	343,050
Active development period	Sep 2025 – Apr 2026
Peak month (Mar 2026)	191 commits
Languages	Python, TypeScript, Dart, Solidity
Repository	github.com/segetii/AMTTP

Table 1: Verified git statistics confirming sole-author, high-velocity engineering output.

Monthly Commit Breakdown:

Month	Commits	Focus
Sep 2025	1	Project inception
Oct 2025	22	Smart contract architecture
Jan 2026	18	ML pipeline & microservices
Feb 2026	115	Full-stack integration & SDKs
Mar 2026	191	Security auditing & production hardening
Apr 2026	14	Research papers & documentation

Table 2: Monthly engineering velocity demonstrating sustained, intensive development.

3. Repository Structure: Polyglot Architecture

The repository spans multiple engineering domains within a single monorepo, proving deep expertise in concurrent system-level architecture:

AMTTP/ (monorepo root)	
+-- contracts/	(38 Solidity files) UUPS proxy, ZK-NAF, CrossChain
+-- backend/	(Oracle Gateway + 10 FastAPI microservices)
+-- oracle-service/	Express.js TypeScript gateway (port 3001)
+-- compliance-service/	orchestrator, sanctions, monitoring
+-- ml/	(XGBoost, LightGBM, GraphSAGE pipelines)
+-- Automation/	risk_engine/ + ml.pipeline/ + models/
+-- frontend/	
+-- frontend/	Next.js App Router (War Room, port 3006)
+-- amttp_app/	Flutter (6-platform consumer app, port 3010)
+-- packages/	
+-- client-sdk/	TypeScript SDK (@amttp/client-sdk)
+-- python-sdk/	Python SDK (amttp)
+-- research/	(3 academic papers, visa docs, UDL framework)
+-- patents/	(8 patent specifications, unified filing)
+-- test/	(Hardhat + Foundry smart contract tests)
+-- audit/	(Slither + Echidna security pipeline)

Figure 2: Repository directory tree showing polyglot monorepo architecture spanning 5 languages and 14+ deployable services.

Key directories: `contracts/` (38 Solidity files), `ml/` (XGBoost/LightGBM/GraphSAGE pipelines), `backend/` (10 FastAPI microservices + Express gateway), `frontend/` (Next.js War Room + Flutter consumer app), `packages/` (TypeScript + Python SDKs).
