

Olusegun Odeyemi

Derby, United Kingdom / +447823676634 / segettii@gmail.com

Executive Summary

Security Engineer & Technical Founder driving the convergence of machine learning, decentralised finance (DeFi), and enterprise risk architecture. With a proven track record of architecting deep-tech solutions from theoretical mathematical models to production-ready software, I specialise in building high-throughput compliance engines capable of processing millions of concurrent transactions with sub-second latency.

As the creator and lead architect of the Anti-Money Laundering Transaction Transfer Protocol (AMTTP), I engineered a full-stack, hybrid infrastructure (Next.js, Flutter, FastAPI, Solidity) that leverages distilled machine learning student models (XGBoost) and Zero-Knowledge Proofs (ZK-SNARKs) to solve systemic regulatory blindness in Web3. Alongside that production platform, I developed my proprietary mathematical framework, Blind-Spot Decomposition Theory (BSDT), as a separate research and optional enterprise analytics capability for modelling hidden failure modes and distributed system instability.

Recognised by industry leaders for bridging complex algorithmic research with commercial application, I bring hands-on expertise in secure-by-design systems, scalable API gateways, and multi-domain threat intelligence. I am uniquely positioned to advance the UK's global leadership in secured digital infrastructure, regulatory technology, and applied artificial intelligence.

Core Competencies

Security Engineering & Technical Architecture

- Secure-by-design application development, API gateway security, and zero-knowledge identity protocols
- Hardening cloud infrastructure and containerised deployments across distributed microservices
- Penetration testing (black-box), vulnerability exploitation, and programmatic remediation of OWASP Top 10 AWS

Machine Learning & Automated Fraud Detection

- Engineering high-accuracy predictive models (XGBoost, GraphML) for real-time anomaly detection
- Processing and classifying millions of concurrent data payloads with high inference speeds
- Architecting automated regulatory policy engines that adapt to high-velocity transactional environments

Data Systems & Secure Enterprise Integrations

- Managing secure multi-million revenue data flows and third-party API dependencies
- Implementing robust Role-Based Access Control (RBAC) across multiple frontend clients
- Engineering custom threat intelligence dashboards and active transaction monitoring systems

Professional Experience

Founder & Lead Architect (AMTTP)
Derby, United Kingdom

August 2023 - Present

- Engineered and deployed a full-stack decentralised compliance MVP integrating Python microservices, a Next.js administrative dashboard, a Flutter consumer client, and Solidity smart contracts.
- Built a real-time ML inference pipeline capable of processing 1M+ transactions with an ROC-AUC of 0.9879 for anomaly detection, deploying distilled student models for CPU-optimised scaling.

• Published groundbreaking research on Blind-Spot Decomposition Theory (BSDT) through TechRxiv and Zenodo, providing a mathematical geometry for detecting systemic infrastructural collapse. • Filed a UK patent protecting the core cryptographic and machine learning methodology underlying distributed transaction compliance.

Technical Account Manager (Logistics & Enterprise APIs) October 2022 – February 2023 Jumia, Lagos, Nigeria

- Managed strategic technical relationships for top-tier enterprise vendors, architecting complex supply chain API integration that streamlined high-throughput inventory routing and drove millions of dollars in sustained e-commerce revenue growth.
- Bridged the gap between commercial partners and internal engineering teams by automating real-time data on pipelines, significantly reducing delivery latency and optimizing last-mile logistics across multi-hub fulfillment ecosystems.
- Protected multi-million revenue payment streams by auditing client integration protocols, identifying deep architectural vulnerabilities, and enforcing stringent API operational controls for commercial accounts.

Cyber Security Engineer & Integration Specialist
Mctoollu Global Concept, Lagos, Nigeria

October 2017 – July 2021

- Programmed and executed automated security testing scripts and manual penetration tests (black-box) against critical third-party web application integrations.
- Exploited and subsequently remediated critical OWASP Top 10 vulnerabilities (including complex XSS and SQL injection vectors) in externally exposed client and supplier systems.
- Architected internal security tooling and vendor risk assessment scripts, automating due diligence pipelines for high-risk supply-chain API onboarding.
- Bridged the gap between technical exploits and executive governance, engineering dashboarding systems to visualise security telemetry and enforce NCSC and ISO 27001 control alignment across external infrastructure.

Technical Toolkit

- Programming & Architecture: Python (FastAPI), TypeScript (Next.js, Node), Dart (Flutter), Solidity, Shell scripting
- Data & ML Infrastructure: XGBoost, Pandas, Memgraph, MongoDB, Redis, Uvicorn • Security & CI/CD: Hard hat, Foundry, Docker, KQL, Zero-Knowledge Proofs (Groth16), API security testing
- Vulnerability Management Tools: Nessus, Qualys, Microsoft Defender, bespoke security scripts

Education and Certifications

Bachelor of Technology, Computer Science and Engineering
Ladoke Akintola University of Technology

Selected Qualifications

- CompTIA Security+ (Certified)
- Advanced Software Architecture & Machine Learning (Independent Research & AMTTP Development)

Professional Interests

- Advancing privacy-preserving cryptography (ZK-SNARKs) in enterprise FinTech applications • Designing low-latency machine learning pipelines for hostile network topologies
- Bridging the technical gap between modern legislative cybersecurity requirements and variable software design
