

MC-1: Public AMTTP Deployment and External Validation

1. Claim

I independently designed and publicly deployed AMTTP, a real-time AML enforcement platform that makes risk decisions before blockchain settlement. This proves more than technical ability: it shows initiative, public release, user exposure, and external validation for an original digital-technology product.

Claim	Evidence	Independent verification
Public product exists	amttp.com live deployment	Cloudflare analytics + public URL
Public interest	1,220 unique visitors; 38,320 requests	Cloudflare independent infrastructure analytics
Working system	4-minute demo and product screens	YouTube demo + War Room screenshots
External validation	Signed/sealed pilot agreement	Glitterati Estates Schedule A + signature/seal

Why this matters: AMTTP shifts AML from post-event reporting to pre-settlement enforcement, directly addressing a major digital-asset compliance problem: once assets move on-chain, reversal is difficult or impossible.

Figure 1: Independent Cloudflare analytics for amttp.com — public traffic evidence outside the applicant's control.

Figure 2: Four-layer architecture: Flutter/Next.js frontends, Express gateway, nine FastAPI services, Solidity contracts.

Anti-loophole note: This exhibit does not rely only on screenshots. It ties the product to third-party infrastructure analytics, a public URL, a video demonstration, and a signed/sealed external pilot document.
