

OC3-3: SDK Distribution and Signed External Pilot Validation

1. Claim

I converted AMTTP from a closed project into externally integrable infrastructure by building TypeScript and Python SDKs, then obtained a signed and company-sealed pilot agreement for evaluation in a real business setting.

Claim	Evidence	Independent verification
SDK distribution path	TypeScript + Python packages	packages/client-sdk and packages/python-sdk
Cross-chain integration	LayerZero support across EVM networks	AMTTPCrossChain contract + SDK
External commercial validation	Signed/sealed pilot agreement	Schedule A + signature/seal exhibit
Bounded claim	Pilot evaluation, not revenue claim	agreement wording and scope

Figure 1: Two SDK packages exposing AMTTP to external integrators.

Figure 2: Schedule A pilot components and signed/sealed signature page together — external validation of evaluation scope.

Why this matters: The signed/sealed pilot is the strongest commercial evidence: an external company accepted defined AMTTP components for evaluation rather than merely viewing a demo.

Anti-loophole note: The claim is deliberately limited to independent pilot validation. It does not overclaim paid production deployment.
