

Tech Nation Visa - Exceptional Promise

Criteria: Supporting Technical Evidence

Applicant: Odeyemi Olusegun Israel

Evidence 3: UK Patent Application (IPO Filing)

1. UK Intellectual Property Filing

To protect the advanced machine learning architecture and cryptographic integration driving the AMTTP system, I filed a UK patent application via the Intellectual Property Office (IPO). This filing is evidence of commercial intent and of my effort to protect what I believe to be original technical work developed through the project.

Figure 1: Official UK IPO Patent Application Receipt (Application No. 1026066039) confirming intellectual property protection for the AMTTP compliance architecture.

2. Summary of Technical Claims

The patent explicitly covers the novel integration methodology where:

- A distilled machine learning student model operates on an off-chain API Gateway to evaluate transaction risks in real-time.

- The off-chain risk score is securely bridged to EVM-compatible block-networks.
- Zero-Knowledge Proofs (ZK-SNARKs) interact with the Smart Contracts to finalize or revert transactions without leaking proprietary user PII on the public ledger.

Patent Abstract (Unified Application): A unified system and method for detecting anomalies, scoring risk, enforcing compliance, and controlling stability across heterogeneous domains. The invention comprises eight subsystems:

- (1) Blind-Spot Decomposition Theory — four-channel diagnostic decomposition of classifier failures;
- (2) Universal Deviation Principle — multi-spectrum operator families with provable detection guarantees;
- (3) GravityEngine — N-body variational scoring with closed-form energy potentials;
- (4) Dimension Magnifier — boundary-centred nonlinear per-dimension transform;
- (5) Risk-Aware Transaction Protocol (AMTTP) — tiered escrow (Approve/Review/Escrow/Block), ML-oracle risk routing, zero-knowledge compliance verification, and cross-chain risk propagation;
- (6) Adaptive Friction Framework — Lyapunov-based adaptive friction for systemic risk detection;
- (7) State-Dependent Viscosity — transfers BSDT functional to computational fluid dynamics;
- (8) UI Integrity Verification — prevents interface manipulation attacks.

Figure 2: Patent abstract detailing the eight core algorithmic subsystems protected under UK IPO Application No. 1026066039.

3. Commercial Strategy

This intellectual property filing supports my enterprise business strategy for AMTTP. It strengthens the platform’s positioning as a scalable B2B infrastructure product that could be licensed to decentralised finance (DeFi) protocols and, in time, to regulated financial institutions seeking pre-settlement compliance tooling.
